

Unit 3 – Linked List

Topic: Smart Canteen Order Management System

Problem Statement

Implement a Smart Canteen Order Management System using a Singly Linked List in C++. The system should maintain student food orders and perform operations such as inserting new orders at the beginning and end, deleting completed orders, searching for a specific order, and displaying all pending orders.

Description

In a college canteen, managing multiple food orders manually can be difficult. This system uses a Singly Linked List to store and manage orders dynamically. Each node represents a food order and contains the order details and a pointer to the next node. The system makes it easier to add, search, display, and remove orders efficiently.
