Unit 3 – Linked List

Topic: Canteen Order Processing Using Linked List

Problem Statement

Develop a menu-driven C++ program to manage student food orders in a college canteen using Singly Linked List, Doubly Linked List, and Circular Linked List. The program performs insertion, deletion, searching, and traversal operations.

Description

Managing multiple food orders in a college canteen can be difficult. This project uses three types of linked lists to store and manage order details dynamically. Each order contains an Order ID, Student Name, and Food Item.

The program allows users to insert new orders, delete existing orders, search for specific orders, and display orders using different traversal methods.
