

Unit 3 – Linked List

Topic: Canteen Order Processing Using Linked List

Problem Statement

Develop a Canteen Order Processing System using a menu-driven C++ program that implements Singly Linked List, Doubly Linked List, and Circular Linked List to manage student food orders. The system should perform insertion, deletion, searching, and traversal operations to efficiently handle canteen orders.

Description

Managing multiple food orders in a college canteen can be difficult. This project uses three types of linked lists: Singly Linked List, Doubly Linked List, and Circular Linked List. It demonstrates how these data structures can store and process food orders using dynamic memory allocation. Users can insert new orders, delete completed orders, search for specific orders, and display order details using the appropriate linked list operations.
